## The Equalizer gun

Impingement style polymer foam application gun

### Description

*The Equalizer - polyurethane foam gun*

Conventional impingement guns do not like back pressure. Too much back pressure and the gun crosses over, resulting in labor intensive gun rebuilds, down time, replacement parts and, in some cases, lost hoses. Back pressure at the spray tip is inherent to levelling slabs, void filling and soil stabilization. The Equalizer gun is the only impingement gun engineered to handle back pressure incurred when dispensing two-component polyurethane foams to lift slabs, fill voids and stabilize soils. Aside from the dispense valves, this gun has no internal moving parts and NO O-rings, which makes rebuilds quick and inexpensive. The Equalizer gun uses an environmentally-friendly, water purge system.

### Primary Applications

- Concrete leveling – slab jacking
- Void filling
- Soil stabilization

### Advantages

- No O-rings
- Versatile – Three injector sizes for various viscosity materials and ratios
- Quick and easy rebuild
- Button head port connection system for soil grouting applications
- Screw-on port for concrete leveling, slab lifting applications

### Compatibility

The Equalizer gun is compatible with most hydraulic, pneumatic and electric proportioners.

### Requirements

A small electric airless sprayer like the Titan Advantage 100, Titan Impact series or similar sprayer is required to pump the flush to the gun head.
